Horn-Schunck Method

Introduction

2

Goal: Estimate pixel motion between two consecutive frames in a video.

Horn–Schunck method: Minimize the energy functional

$$E = \iint \underbrace{(I_x u + I_y v + I_t)^2}_{\text{constant brightness}} + \underbrace{\alpha^2 (\|\nabla u\|^2 + \|\nabla v\|^2)}_{\text{spatial smoothness}} dx dy$$

where:

- **I_x , I_y , I_t** : derivatives of image intensity **I** along the x, y, and t.
- **α** : a regularization constant.

Introduction

3

The functional **E** can be minimized by solving the **Euler–Lagrange** equations:

$$\begin{aligned}\frac{\partial L}{\partial u} - \frac{\partial}{\partial x} \frac{\partial L}{\partial u_x} - \frac{\partial}{\partial y} \frac{\partial L}{\partial u_y} &= 0 \\ \frac{\partial L}{\partial v} - \frac{\partial}{\partial x} \frac{\partial L}{\partial v_x} - \frac{\partial}{\partial y} \frac{\partial L}{\partial v_y} &= 0\end{aligned}$$

$$\begin{aligned}I_x(I_x u + I_y v + I_t) - \alpha^2 \Delta u &= 0 \\ I_y(I_x u + I_y v + I_t) - \alpha^2 \Delta v &= 0\end{aligned}$$

where **L** is the integrand of **E**, and Δ is the Laplace operator.

Using finite difference approximation, we get an **iterative scheme**:

$$u^{k+1} = \bar{u}^k - \frac{I_x(I_x \bar{u}^k + I_y \bar{v}^k + I_t)}{\alpha^2 + I_x^2 + I_y^2}$$

$$v^{k+1} = \bar{v}^k - \frac{I_y(I_x \bar{u}^k + I_y \bar{v}^k + I_t)}{\alpha^2 + I_x^2 + I_y^2}$$

where $\bar{u}(x, y)$ is a weighted avg. of u around the pixel at (x, y) :

$$\begin{array}{ccc}1/12 & 1/6 & 1/12 \\ 1/6 & * & 1/6 \\ 1/12 & 1/6 & 1/12\end{array}$$

Implement H-S on GPU

4

Input: Frame pair (I_1 , I_2)

Step 1: Compute Intensity Derivatives (GPU kernel)

- Apply Sobel derivative operator $\rightarrow \mathbf{I}_x, \mathbf{I}_y$
- Temporal difference $\rightarrow \mathbf{I}_t$
- Obtain values for each pair of frames

$$G_x = \frac{1}{8} \begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix}$$

$$G_y = \frac{1}{8} \begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$$

Step 2: Iterative Solver (GPU kernel)

- Initialize: $U = 0, V = 0$
- Loop num_iter: Update $\mathbf{U}, \mathbf{V}$ from neighbors, Swap ($\mathbf{U}_{old} \leftrightarrow \mathbf{U}_{new}$)

Output: Flow field ($\mathbf{U}, \mathbf{V}$)

Implement H-S on GPU

5

One frame

height = 1080 pixels

width = 1920 pixels

```
// Each block uses 18x18 threads to process a  
// 16x16 pixel region + Halo around the region  
dim3 block(18, 18);
```

```
// Divide a frame into a grid of blocks  
dim3 grid((width + 15) / 16, (height + 15) / 16);
```

H-S with Shared Memory

6

```
__global__ void compute_derivatives(...){  
    // Step 1: Shared mem. declaration: 16x16 block + 1-pixel halo  
    __shared__ float s_tile[18][18];  
    int x = bx * 16 + tx - 1; // find global x coordinate  
    int y = by * 16 + ty - 1; // find global y coordinate  
  
    // Step 2: Load data into shared memory  
    s_tile[ty][tx] = I1[y * width + x];  
    __syncthreads(); // barrier to make sure all threads finish  
  
    // Step 3: only compute derivatives on internal pixels  
    if (tx >= 1 && tx <= 16 && ty >= 1 && ty <= 16) {  
        float I_ul = s_tile[ty - 1][tx - 1]; // read from shared mem.  
        float I_um = ...  
  
        float gx = ... // compute horizontal sobel derivative  
        float gy = ... // compute vertical sobel derivative  
    }  
}
```

Block: shares memory

H-S with Distributed Memory

8

Frame are distributed across MPI ranks:

- Rank 0: frames 0-16
- Rank 1: frames 16-32
- Rank 2: frames 32-48
- Rank 3: frames 48-63

Flow magnitudes need to be normalized, so the ranks:

- Share local max
- Receive global max

// Rank 0 loads video

```
if (rank == 0)
    load_frames_and_metadata();
```

// Rank 0 distributes frame subsets to each rank

```
MPI_Scatterv(flat.data(), send_counts, displs, ...,
    recv_buf.data(), ...);
```

// Each rank runs GPU optical flow on its local frames

```
local_max_mag = process_frame_range(local_frames, ...);
```

// All ranks share local max → all receive global max

```
MPI_Allreduce(&local_max_mag, &global_max_mag, 1,
    MPI_FLOAT, MPI_MAX, MPI_COMM_WORLD);
```

// All ranks send flow results → Rank 0 collects

```
MPI_Gatherv(local_U.data(), ..., U_all.data(), ...);
```

Roofline Analysis on HS

12

$$u^{k+1} = \bar{u}^k - \frac{I_x(I_x \bar{u}^k + I_y \bar{v}^k + I_t)}{\alpha^2 + I_x^2 + I_y^2}$$
$$v^{k+1} = \bar{v}^k - \frac{I_y(I_x \bar{u}^k + I_y \bar{v}^k + I_t)}{\alpha^2 + I_x^2 + I_y^2}$$

44 FLOPS / pixel:

8-point average for U: 8 mults + 7 adds = **15** FLOPs. Same for V: **15** FLOPs.

Numerator: 2 mults + 2 adds = **4** FLOPs. Denominator: 2 + 2 = **4** FLOPs.

Update U and V: 2 × (1 mult + 1 div + 1 sub) = **6** FLOPs.

33.3 bytes / pixel:

Block loads: 5 arrays × 18×18 tiles = 6,480 bytes.

Block writes: 2 arrays × 16×16 tiles = 2,048 bytes. Total: 8,528 bytes per block

Per pixel: 8,528 bytes ÷ 256 pixels = 33.3 bytes/pixel

$$AI = \frac{44\text{FLOPs}}{33.3\text{bytes}} = 1.32\text{FLOP/byte}$$

Roofline Analysis on HS

13

The H-S kernel is memory-bound.

Limitations

14

- ❖ Load balancing
 - When we dealt with longer or higher resolution videos, we ran into data overflow issues
 - If we streamed our frames in batches and only sent new work to a rank after it finished its current batch, we could keep memory usage bounded and improve load balancing for very long / 4K videos.
- ❖ Video writing
 - To increase parallelization and decrease processing time further, we could offload the video writing step to the GPU.
 - Using a GPU-accelerated encoder would let us write frames faster and avoid the bottleneck of finishing the main computation.

Thank
